

HIGH TEMPERATURE EXHAUST PAINTS

Hycote Very High Temperature Paint is a quick drying, high quality, extreme temperature resistant (450°C - 650°C, depending on colour) solution to the problems of a discoloured tubular manifold spoiling the appearance of an otherwise immaculate engine bay. Its acrylic, rust inhibiting formula means the end of unsightly surface rust coming back again and again.

But that's not all - it's also perfect for refinishing other exhaust components, in fact most items on cars, motorcycles etc. that are subjected to regular high temperatures including brake drums, pipes and engines.

MGOC Spares stock Hycote Very High Temperature Paint in a choice of four colours: matt silver, matt black, matt red or matt white. The paint is supplied in a 400ml aerosol can.

Easy to use. A good paint finish is always totally reliant on preparation, so don't skimp on the time you put in to rubbing down, smoothing and cleaning. The paint itself is a high-build acrylic, very easy to apply and quick drying, so two thick coats can be comfortably applied in under an hour to give a durable finish.

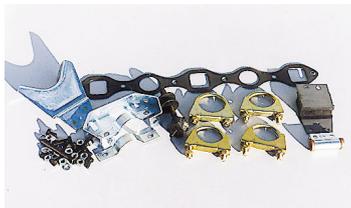

Basic hand tools required. Wire brush, wet and dry paper etc. for rubbing down and preparation. Masking tape and plenty of newspaper if the component is to be painted in position on the car (needless to say, it's usually better and easier to remove it from the car for spraying).
